Landfarm Fertilizer Needs / Hints

Slow Release Ferts

- Don't use slow release fertilizer

- Want the nutrients when we need them to stimulate the bugs

- Slow release ferts dependent on moisture to release - a limiting factor in many cases

- Avoiding slowing the project down

- Use soluble fert mix to distribute

- Use moisture air to distribute in gas form (Phoster -like)

TRPH landfarming

- Convert TRPH ppm to BOD ppm

- Then, 100 ppm BOD : 10 ppm N : 2 ppm

- Peters colorless, for example

- 20:10:20 fert with high N so denitrifiers can work sans oxygen

- Don't use urea N (?)

- Winter temps can slow you down (even in Southern states, like N.C., for example)

Perform quarterly monitoring for TPH
